Configure Source Control

Configure Source Control

When working with a solution stored in a repository and using Scene Composer's built-in source control integration, you must configure an external comparison and merge tool.

To configure this, open the Preferences dialog (**File** > **Preferences** in the menu bar). In the **Source Control** section, specify the application to be used for merge and diff operations. You can also define the command-line parameters required for each operation (e.g. **Merge** and **Diff**).

Before performing any merge operations, ensure that the external merge tool is **enabled** by selecting the corresponding checkbox.

Enabled	If enabled, the use of the configured merge tool is enabled.
Merge Tool	Configures the path to the external merge tool to use.
Merge	Specifies the commands for merge operations.
Diff	Specifies the commands for diff operations.

Synchronized mode	If enabled, Scene Composer automatically retrieves the solution status from the server. Because communication with the server can be time-consuming, you may choose to disable this option. In that case, you can manually update the status by selecting **Refresh status** from the source control context menu whenever needed.

> The value of the **Enabled** checkbox is evaluated only when a solution is opened or created.
